

and the butcher slaughter them as they are needed, that the cotton and woollen manufacturers will go on preparing cloth, and the tailor be always ready to make it up for them into clothes whenever it is ordered. Beyond this conviction they have nothing; they possess no stock of circulating capital themselves, nor do the persons who are afterwards to supply food and clothing during the whole time such undertakings are in progress, possess any such stock at the moment when they are commenced.

Of all the important operations which require more than a year to complete them, and that they all are important, as far as the production of wealth is concerned, does not require to be asserted,—by far the most important is the rearing of youth and teaching them skilled labour, or some wealth-creating art. I am particularly desirous of directing the reader's attention to this *productive operation*, because, if the observations I have already made be correct, all the effects usually attributed to accumulation of circulating capital are derived from the *accumulation and storing up of skilled labour*; and, because this most important operation is performed, as far as the great mass of the labourers is concerned without any *circulating capital* whatever. The labour of the parents produces and purchases, with what they receive as *wages*, all the food and the clothing which the rising generation of labourers use, while they are learning those arts by means of which they will hereafter produce all the wealth of society. For the rearing and educating all future labourers (of course I do not mean *book* education, which is the smallest and least useful part of all which they have to learn) their parents have no stock stored up beyond their own practical skill. Under the strong influence of natural affection and parental love, they prepare by their toils, continued day after day, and year after year, through all the long period of the infancy and childhood of their offspring, those future labourers who are to succeed to their toils and their hard fare, but who will inherit their productive power, and be what they now are the main pillars of the social edifice.

If we duly consider the number and importance of those wealth-producing operations which are not completed within the year, and the numberless products of daily labour, necessary to subsistence, which are consumed as soon as produced, we shall, I think, be sensible that the success and productive power of every different species of labour is at all times more dependant on the co-existing productive labour of other men than on any accumulation of circulating capital. The labourer, having no stock of commodities, undertakes to bring up his children, and teach them an useful art, always relying on his own labour; and various classes of persons undertake tasks, the produce of which is not completed for a long period, relying on the labour of other men to procure them, in the mean time, what they require for subsistence. All classes of men carry on their daily toils in the full confidence that while each is en-

gaged in his particular occupation, some others will prepare whatever he requires, both for his immediate and future consumption and use. I have already explained, that this confidence arises from that law of our nature by which we securely expect the sun will rise to-morrow, and that our fellow-men will labour on the morrow and during the next year as they have laboured during the year and the day which have passed. I hope I have also satisfied the reader that there is no knowledge of any produce of previous labour stored up for use, that the effects usually attributed to a stock of commodities are caused by co-existing labour, and that it is by the command the capitalist possesses over the *labour of some men*, not by his possessing a stock of commodities, that he is enabled to support and consequently employ other labourers.

I come now to examine, secondly, the NATURE and EFFECTS of FIXED CAPITAL. Fixed capital consists of the tools and instruments the labourer works with, the machinery he makes and guides, and the buildings he uses either to facilitate his exertions or to protect their produce. Unquestionably by using these instruments man adds wonderfully to his power. Without a hand-saw, a portion of fixed capital, he could not cut a tree into planks; with such an instrument, he could, though it would cost him many hours or days; but with a saw mill, he could do it in a few minutes. Every man must admit that by means of instruments and machines, the labourer can execute tasks he could not possibly perform without them; that he can perform a greater quantity of work in a given time, and that he can perform the work with greater nicety and accuracy than he could possibly do had he no instruments and machines. But the question then occurs, what produces instruments and machines, and in what degree do they aid production independent of the labourer, so that the owners of them are entitled to by far the greater part of the whole produce of the country? Are they, or are they not the produce of labour? Do they, or do they not constitute an efficient means of production, separate from labour? Are they or are they not so much inert decaying and dead matter, of no utility whatever, possessing no productive power whatever, but as they are guided, directed and applied by skilful hands. The reader will be able instantly to answer these questions, and I only add my answers because they lead to some conclusions different from those generally adopted.

It is admitted by those who contend most strenuously for the claims of capital, that all instruments and machines are the produce of labour. They add, however, that they are the produce of previous labour, and are entitled to profit, on account of having been saved or stored up. But the manufacture of instruments and tools is quite as uninterrupted as the manufacture of food and clothing. They are not all consumed or used within a year, but they are brought into use as soon as possible after they are made. Nobody who manufactures them stores them up; nor does he make them for this purpose. As long as

they are merely the result of *previous* labour, and are not applied to their respective uses by labourers, they do not repay the expense of making them. It is only when they are so applied that they bring any profit. They are made solely for the use of the labourer, and directly they come into his hands they return or repay the capitalist the sum they cost him; and over and above this the labourer must give him an additional sum corresponding to the rate of profit in the country. It is plainly not the previous creation of these things which entitles them to profit, for most of them diminish in value from being kept. A man must pay also as much profit for the use of an instrument in proportion to the labour of making it, whether it be like sewing needles, of which many are used and made in the course of the week, or like a ship, or a steam engine, one of which lasts several years. Fixed capital does not derive its utility from previous, but present labour; and does not bring its owner a profit because it has been stored up, but because it is a means of obtaining a command over labour.

The production of fixed capital cannot be attributed to circulating capital, in the ordinary sense; but certainly those who make instruments must be confident they will be able to obtain food, or they would never think of making instruments. The smith, while he is making or mending the farmer's plough-share, trusts to the farmer to do his part in procuring a supply of food; and the farmer, while he tills his fields, trusts to the smith to prepare for him the necessary instruments. These instruments are not the produce of circulating capital and of labour, but of labour alone, and of the labour of two or more co-existing persons. All fixed capital, not only in the first instance, as is generally admitted, but in every stage of society, at every period in the history of man, is the creation of labour and of skill, of different species of labour and skill certainly, but of nothing more than labour and skill.

After any instruments have been made, what do *they* effect? Nothing. On the contrary, they begin to rust or decay unless used or applied by labour. The most perfect instrument which the cunning hand of man can make, is not instinct with life, and it constantly needs the directing hand of its creator, or of some other labourer. An artist may indeed make an automaton or a time-piece, which will move for a certain period without further labour, but the motion he gives it, is, in this case, the final object and aim of labour, and the instruments are not called fixed capital, because they are not used for further production. The automaton may be exhibited by its owner for money, and the time-piece, if employed to determine the longitude of a ship may be a portion of fixed capital, useful in that production which is occasioned by commerce. In this case, however, there is an observer required, and it is by his labour and skill, he making use of the time-piece that the ship's place is ascertained. Whether an instrument shall be regarded as productive capital

or not, depends entirely on its *being used*, or not, by some productive labourer.

The most perfect instruments, ever made by labour, require, as in the case of a time-piece, a *peculiar skill* to render them productive. A ship, for example, is undoubtedly a noble instrument, as admirable and useful a portion of fixed capital as the hand of man ever created, or his skill ever employed. By it the wealth of Great Britain has been and will be augmented. But our navy would lye and rot, unless care were taken to preserve it; and the ships when turned adrift would be bruised by the waves, the winds, or the rocks, unless they were guided by seamen. By the skill acquired during many years experience, and by much labour guided by this skill a ship is built. It would trouble me to enumerate the various species of industry which are necessary to prepare her for sea. There is the skill and labour of the draftsman, of the working shipwright, of the carpenter, the mast-maker, the sail-maker, the rope-maker, the cooper, the founder, the smith, the copper-smith, the compass-maker, &c. &c., but there is nothing necessary more than the skill and labour of these different persons. After she is made ready the same qualities watch over her, check the first indications of decay, and repair every little defect occasioned by accident and time: She is then, however, of no use unless there are seamen to manage her. To conduct her safely from port to port, and from hemisphere to hemisphere, a great deal of knowledge of the winds and tides, of the phenomena of the heavens, and of the laws which prevail on the surface of the earth is necessary; and only when this knowledge is united with great skill, and carried into effect by labour, can a ship be safely conducted through the multitude of dangers which beset her course. To have and to use this fixed capital, knowledge, labour and skill are necessary. Without these it could not be made, and when made it would be less productive than the clod from which its materials spring, or from which they are fashioned by the hand of man.

A road is made by a certain quantity of labour, and is then called fixed capital; the constant repairs it needs, however, are a continual making, and the expense incurred by them is called circulating capital. But neither the circulating, nor the fixed capital return any profit to the road-makers, unless there are persons to travel over the road, or make a further use of their labour. The road facilitates the progress of the traveller, and just in proportion as people do travel over it, so does the labour which has been employed on the road become productive and useful. One easily comprehends why both these species of labour should be paid,—why the road-maker should receive some of the benefits, accruing only to the road user; but I do not comprehend why all these benefits should go to the *road* itself, and be appropriated by a set of persons who neither make nor use it, under the name of profit for their capital. One is

almost tempted to believe that capital is a sort of cabalistic word, like church or state, or any other of those general terms which are invented by those who fleece the rest of mankind to conceal the hand that shears them. It is a sort of idol before which men are called on to prostrate themselves, while the cunning priest from behind the altar, profaning the God whom he pretends to serve, and mocking those sweet sentiments of devotion and gratitude, or those terrible emotions of fear, and resentment, one or the other of which seems common to the whole human race, as they are enlightened and wise, or ignorant and debased, puts forth his hand to receive and appropriate the offerings which he calls for in the name of religion.

A steam engine also is a most complete instrument, but alas, for the capitalist, it does not go of itself. A peculiar skill is required to make it and put it up, and peculiar skill and labour must afterwards direct and regulate its movements. What would it produce without the engineer? To the stranger who did not possess the engineer's skill, only misery, death, and destruction. Its vast utility does not depend on stored up iron and wood, but on that practical and living knowledge of the powers of nature which enables some men to construct it, and others to guide it.

If we descend to more minute instruments, and consider such as are guided by the hand, the necessity of skill and labour, and the utter worthlessness of capital by itself, will be still more obvious. It has been asked, what could a carpenter effect without his hatchet and his saw? I put the converse of the question, and ask what the hatchet and the saw could effect without the carpenter? Rust and rottenness must be the answer. A plough or a scythe may be made with the most cunning art, but to use either of them a man must have an adroit turn of the hand, or a peculiar species of skill. The shoemaker who can thrust awls through leather with singular dexterity and neatness, cannot make any use of a watchmaker's tools; and the most skilful and dexterous maker of plane, saw, and chisel-blades, would find it difficult to construct with them any of that furniture which the cabinet-maker forms with so much dispatch and beautiful effect. Almost every species of workman, however, from having acquired a certain dexterity in the use of his hands, and from having frequently seen the operations of other workmen, could learn the art of another man much better than a person who had never practised any kind of manual dexterity, and never seen it practised. But if a skilled labourer could not direct any kind of instruments so well as the man who has been constantly accustomed to use them, it is plain that the whole productive power of such instruments must depend altogether on the peculiar skill of the artizan and mechanic, who has been trained to practise different arts. Fixed capital, of whatever species, then, is only a costly production, costly to make, and costly to preserve, without that particular species of skill and labour, which guides each instrument, and which, as I have before shown, is nourished, instructed, and maintained by wages alone. The

utility of the instruments the labourer uses, can in no wise be separated from his skill. Whoever may be the owner of fixed capital—and in the present state of society he who makes it, is not, and he who uses it, is not,—it is the hand and knowledge of the labourer which make it, preserve it from decay, and which use it to any beneficial end.

For a nation to have fixed capital then, and to make a good use of it, three things, and only three things seem to me to be requisite. First, knowledge and ingenuity for inventing machines. No labourer would, I am sure, be disposed to deny to these their reward. But no subject of complaint is more general or more just, than that the inventor of any machine, does not reap the benefit of it. Of all the immense number of persons who have acquired large fortunes by the modern improvements in steam engines, and cotton mills, Mr. Watt and Mr. Arkwright are the only two, I believe, who have been distinguished for their inventions. They also acquired wealth, less as inventors than as capitalists. Mr. Watt found a capitalist who appreciated his genius, and Mr. Arkwright saved and borrowed the means of profiting by his own inventions. Thousands of capitalists have been enriched by inventions and discoveries of which they were not the authors, and capital by robbing the inventor of his just reward, is guilty of stifling genius. The second requisite for having fixed capital is the manual skill and dexterity for carrying these inventions into execution. The third requisite is the skill and labour to use these instruments after they are made. Without knowledge they could not be invented, without manual skill and dexterity they could not be made, and without skill and labour they could not be productively used. But there is nothing more than knowledge, skill, and labour requisite, on which the capitalist can found a claim to any share of the produce.

Naturally and individually man is one of the most feeble and destitute of all created animals. His intelligence, however, compensates for his physical inferiority. After he has inherited the knowledge of several generations, and when he lives congregated into great masses, he is enabled by his mental faculties to complete, as it were, the work of nature, and add to his intelligence the physical powers of the lower animals. He directs his course on the waters, he floats in the air, he dives into the bowels of the earth, and all which its surface bears he makes tributary to his use. The gales which threaten at first to blow him from the earth, grind his corn, and waft to him a share in the treasures of the whole world. He creates at his pleasure the devouring element of fire, and checks its progress, so that it destroys only what he has no wish to preserve. He directs the course of the stream, and he sets bounds to the ocean; in short he presses all the elements into his service, and makes nature herself the hand-maid to his will. The instruments he uses to do all this, which have been invented by his intelligence to aid his feeble powers, and which are employed by his skill and

his hands, have been called fixed capital; and shutting out of view MAN himself, in order to justify the existing order of society, which is founded on property or possessions, and the existing oppression of the labourer, who forms unhappily part of these possessions,—all these glorious effects have been attributed with a more extraordinary perversion of thought, perhaps, than is to be found in any other department of knowledge, to fixed and circulating capital. The skill and the art of the labourer have been overlooked, and he has been vilified; while the work of his hands has been worshipped.*

I have now shewn the reader that the effects attributed to circulating capital, result from co-existing labour, and the assurance common to each labourer, that he will be able to procure what he wants; or that while he is at work other men are also at work. I have also shewn that fixed capital is produced by the skill of the labourer. Circulating capital, consisting of food and clothes, is created only for consumption; while fixed capital, consisting of instruments and tools, is made, not to be consumed, but to aid the labourer in producing those things which are to be consumed. There is no analogy between these two descriptions of commodities, except that both are the produce of labour, and both give the owner of them a profit.

There is, however, a striking difference between them which deserve to be noticed. It is usually stated that “the productive industry of any country is in proportion to its capital, increases when its capital increases, and declines when its capital declines.” This position is true, only of circulating capital, but not of fixed capital. The number of productive labourers depends certainly on the quantity of food, clothing, &c. produced and appropriated to their use; it is not, however, the *quantity* but the *quality* of the fixed capital on which the productive industry of a country depends. Instruments are productive, to use the improper language of the Political Economist, not in proportion as they multiplied but as they are efficient. It is probable, that since Mr. Watt’s improvements on the steam-engine

* In all errors, which are generally adopted, there is a tolerable substratum of truth. In the present case the substratum of truth is this:—There was a time in society when CAPITAL and CAPITALISTS were of most essential service to it. On the establishment of towns in Europe, and on the introduction of manufactures into them, they became the refuge of all the oppressed and enslaved peasantry who could escape from their feudal tyrants. The capitalists and manufacturers who inhabited them were also skilled labourers, and really gave employment and protection to the peasantry. They taught them useful arts, and hence became invested with the character of benefactors, both to the poor and the state. They were infinitely better than the feudal barons with whom they were compared; and the character they then acquired they now retain. The veneration men have for CAPITAL and CAPITALISTS, is founded on a sort of superstitious, and transmitted notion of their utility in former times. But they have long since reduced the ancient tyrant of the soil to comparative insignificance, while they have inherited his power over all the labouring classes. It is, therefore, now time that the reproaches so long cast on the feudal aristocracy should be heaped on capital, and capitalists; or on that still more oppressive aristocracy, which is founded on wealth, and which is nourished by profit.

one man can perform as much work with these instruments as ten did before. As the *efficiency* of the fixed capital is increased by men obtaining greater knowledge and greater skill, it is quite possible, and is the case, that a greater quantity of commodities, or a greater means of nourishing and supporting men, is obtained with less capital. Although, therefore, the number of labourers must at all times depend on the *quantity* of circulating capital; or, as I should say, on the quantity of the products of co-existing labour, which labourers are allowed to consume; the quantity of commodities they produce will depend on the *efficiency* of their fixed capital. Circulating capital nourishes and supports men as its quantity is increased; fixed capital as a means of nourishing and supporting men, depends for its efficiency, altogether on the skill of the labourer, and consequently the productive industry of a country, as far as fixed capital is concerned, is in proportion to the knowledge and skill of the people.

The warmest admirers of circulating capital will not pretend that it adds in the same way as fixed capital to the productive power of the labourer. The most extraordinary visionary who ever wrote cannot suppose circulating capital adds any thing to productive power. The degree and nature of the utility of both species of capital is perfectly different and distinct. The labourer subsists on what is called circulating capital, he works with fixed capital. But equal quantities, or equal values of both these species of capital bring their owner precisely the same amount of profit. We may, from this single circumstance be quite sure that the share claimed by the capitalist for the use of fixed capital is not derived from the instruments increasing the efficiency of labour, or from the utility of these instruments; and profit is derived in both cases from the power which the capitalist has over the labourer who consumes the circulating, and who uses the fixed capital. How he obtained this power I shall not now enquire, further than to state, that it is derived from the whole surface of the country, having been at one period monopolized by a few persons; and the consequent state of slavery in which the labourer formerly existed in this country, as well as throughout Europe. As the profits of the capitalist on fixed capital are not derived from the utility of these instruments, it is useless to enquire what share ought to belong to the owner of the wood and iron, and what share ought to belong to the person who uses them. He who makes the instruments is intitled, in the eye of justice, and in proportion to the labour he employs to as great a reward as he who uses them; but he is not entitled to a greater; and he who neither makes nor uses them has no just claim to any portion of the produce.

Betwixt him who produces food and him who produces clothing, betwixt him who makes instruments and him who uses them, in steps the capitalist, who neither makes nor uses them, and appropriates to himself the produce of both. With as niggard a hand as possible he transfers to each a part of the produce of the other, keeping to himself the larger share. Gradually and suc-

essively has he insinuated himself betwixt them, expanding in bulk as he has been nourished by their increasingly productive labours, and separating them so widely from each other, that neither can see whence that supply is drawn which each receives through the capitalist. While he despoils both, so completely does he exclude one from the view of the other, that both believe they are indebted to him for subsistence. He is the *middle man* of all labourers; and when we compare what the skilled labour of England produces, with the produce of the untutored labour of the Irish peasantry, the middle men of England cannot be considered as inferior in their exactions, to the middle men of Ireland. They have been more fortunate, however, and while the latter are stigmatized as oppressors, the former are honoured as benefactors. Not only do they appropriate the produce of the labourer; but they have succeeded in persuading him that they are his benefactors and employers. At least, such are the doctrines of political economy; and capitalists may well be pleased with a science which both justifies their claims, and holds them up to our admiration, as the great means of civilizing and improving the world.

To shew the labourer the effects which bestowing this abundant reward on the supposed productive powers of food, clothing, and instruments, has on his poverty or wealth, I must observe that all political economists agree in saying, that all savings in society are usually made by capitalists. The labourer cannot save; the landlord is not disposed to save; whatever is saved is saved from profits, and becomes the property of the capitalists. Now let us suppose that a capitalist possesses when profit is at 10 per cent. per annum, 100 quarters of wheat, and 100 steam engines, he must, at the end of a year be paid for allowing the labourer to eat this wheat, and use these steam engines, with 110 quarters of wheat, and 110 steam engines, all in the same excellent condition as the 100 steam engines were at the beginning. It being an admitted principle, that, after a portion of fixed capital is prepared, it must be paid for at a rate sufficient to pay the ordinary rate of interest, and provide for the repairs or the remaking of the instrument. Let us suppose that five quarters of wheat and five steam engines, or the value of this quantity suffices for the owner's consumption, and that the other five of his profit being added to his capital he has the next year one hundred and five quarters of wheat, and one hundred and five steam engines which he allows labourers to eat or use; for these the labourer must produce for him, the following year, supposing the rate of profit to continue the same, a sufficient sum to replace the whole of this capital, with the interest, or 115 quarters four bushels of wheat, and 115½ steam engines. Supposing that the value of the five quarters, and of five steam engines suffices for the consumption of the capitalist, he will have the next year 110 quarters 4 bushels, and 110½ steam engines, for the use of which he must be paid at the same rate; or the labourer must produce and give him the third year, 121 quarters and 1-20th of a quarter, and 121

steam-engines, and 1-20th of a steam-engine. It is of no use calculating all these fractions, or carrying the series further; it is enough to observe that every atom of the capitalist's revenue, which he puts out to use, or as it is called saves, which means given or lent to labourers, goes on increasing at compound interest. Dr. Price has calculated that the sum of one penny put out to compound interest at Our Saviour's birth, at five per cent., would, in the year 1791, amount to a sum greater than could be contained in three hundred millions of globes like this earth, all solid gold.

Perhaps I can make the evil effects of capital more apparent by another sort of example. The *real price* of a coat or a pair of shoes, or a loaf of bread, *all* which nature demands from man in order that he may have either of these very useful articles, is a certain quantity of labour; how much it is almost impossible to say, from the manufacture of a coat, a pair of shoes, or a loaf of bread, being completed by many persons. But for the *labourer* to have either of these articles, he must give over and above the quantity of labour nature demands from him, a still larger quantity to the capitalist. Before he can have a coat, he must pay interest for the farmer's sheep, interest on the wool after it has got into the hands of the wool merchant, interest for this same wool as raw material, after it is in the hands of the manufacturer, interest on all the buildings and tools he uses, and interest on all the wages he pays his men. Moreover he must pay interest or profit on the tailor's stock, both fixed and circulating, and this rate of interest is increased in all these instances by something more being always necessary to pay the rent of all these different capitalists. In the same manner before a labourer can have a loaf of bread, he must give a quantity of labour more than the loaf costs, by all that quantity which pays the profit of the farmer, the corn dealer, the miller, and the baker, with profit on all the buildings they use; and he must moreover pay with the produce of his labour the rent of the landlord. How much more labour a LABOURER must give to have a loaf of bread than that loaf costs, it is impossible for me to say. I should probably underrate it were I to state it at six times; or were I to say that the real cost of that loaf, for which the labourer must give sixpence, is one penny. Of this, however, I am quite certain, that the Corn Laws, execrable as they are in principle, and mischievous as they are to the whole community, do not impose any thing like so heavy a tax on the labourer as capital. Indeed, however injurious they may be to the capitalist, it may be doubted whether they are so to the labourer. They diminish the rate of profit, but they do not in the end lower the wages of labour. Whether there are Corn Laws or not, the capitalist must allow the labourers to subsist, and as long as his claims are granted, and acted on, he will never allow him to do more. In other words the labourer will always get much about the same quantity of bread, whether the loaf be the produce of one hour's, or one day's labour. Knowing the vast

influence capitalists have in society, one is not surprised at the anathemas which have of late been hurled against the Corn Laws, nor at the silence, which has been preserved with respect to their more mighty, and, to the labourer, more mischievous exactions.

What the capitalist really puts out to interest, however, is not gold or money, but food, clothing, and instruments; and his demand is always to have more food, clothing, and instruments produced than he puts out. No productive power can answer this demand, and both the capitalists and political economists find fault with the wisdom of nature, because she refuses to minister to the avarice of the former, and does not exactly square in her proceedings with the wishes of the latter.

Of course the ultimate term to which compound interest tends, can never be reached. Its progress is gradually but perpetually checked, and it is obliged to stop far short of the desired goal. Accordingly, in most books on Political Economy, one or the other of two causes is assigned for the constant falling off of profit in the progress of society. The political economists either say with Adam Smith, that the *accumulation of capital* lowers profits, or, with Mr. Ricardo, that profits are lowered by the *increasing difficulty of procuring subsistence*. Neither of them has assigned it to the right cause, the impossibility of the labourer answering the demands of the capitalist. A mere glance must satisfy every mind that *simple profit* does not decrease but increase in the progress of society—that is, the same quantity of labour which at any former period produced 100 quarters of wheat, and 100 steam engines, will now produce somewhat more, or the value of somewhat more, which is the same thing: or where is the utility of all our boasted improvements? In fact, also, we find that a much greater number of persons now live in opulence on profit in this country than formerly. It is clear, however, that no labour, no productive power, no ingenuity, and no art can answer the overwhelming demands of compound interest. But all saving is made from the revenue of the capitalist, so that actually these demands are constantly made, and as constantly the productive power of labour refuses to satisfy them. A sort of balance is, therefore, constantly struck. The capitalists permit the labourers to have the means of subsistence, because they cannot do without labour, contenting themselves very generously with taking every particle of produce not necessary to this purpose. It is the overwhelming nature of the demands of capital sanctioned by the laws of society, sanctioned by the customs of men, enforced by the legislature, and warmly defended by political economists, which keep, which ever have kept, and which ever will keep, as long as they are allowed and acquiesced in, the labourer in poverty and misery.

It is the everwhelming and all-engrossing nature of compound interest, also, which gives to Mr. Ricardo's theory and his definitions, as I have already described them, though this princi-

ple is no where brought sufficiently into view in his book, their mathematical accuracy and truth. I refer to them, not as caring much to illustrate the subtleties of that ingenious and profound writer, but because his theory confirms the observations I have just made ; viz.—that the exactions of the capitalist cause the poverty of the labourer. It is an admitted principle that there cannot be two rates of profit in a country, and therefore the capital of the man who cultivates the best soil of a country, procures for its owner no more than the capital of the man who cultivates the worst soil. The superior produce of the best soil is not, therefore, profit, and Mr. Ricardo has called it rent. It is a portion of produce, over and above the average rate of profit, and Mr. Ricardo has assigned it to the landlords. The labourer must, however, live, though the exorbitant claims of capital allow him only a bare subsistence. Mr. Ricardo has also been aware of this, and has therefore justly defined the price of labour to be such a quantity of commodities as will enable the labourers, one with another, to subsist, and to perpetuate their race, without either *increase or diminution*. Such is all which the nature of profit or interest on capital will allow them to receive, and such has ever been their reward. The capitalist must give the labourers this sum, for it is the condition he must fulfil in order to obtain labourers ; it is the limit which nature places to his claims, but he never will give, and never has given, more. The capitalists, according to Mr. Ricardo's theory, allow the landlords to have just as much as keeps all the capitalists on a level ; the labourer they allow, in the same theory, barely to subsist. Thus Mr. Ricardo would admit that the cause of the poverty of the labourer is the engrossing nature of compound interest ; this keeps him poor, and prevents him from obeying the commands of his Creator, to increase and multiply.

Though the defective nature of the claims of capital may now be satisfactorily proved, the question as to the wages of labour is by no means decided. Political economists, indeed, who have insisted very strongly on the necessity of giving security to property, and have ably demonstrated how much that security promotes general happiness, will not hesitate to agree with me, when I say, that whatever labour produces ought to belong to it. They have always embraced the maxim of permitting those to "reap who sow ;" and they have maintained that the labour of a man's body and the work of his hands are to be considered as exclusively his own. I take it for granted, therefore, that they will henceforth maintain that the whole produce of labour ought to belong to the labourer. But though this, as a general proposition, is quite evident, and quite true, there is a difficulty in its practical application, which no individual can surmount. There is no principle or rule, as far as I know, for dividing the produce of joint labour among the different individuals who concur in production, but the judgment of the individuals themselves ; that judgment, depending on the value men may set on different species of labour, can never be known,

nor can any rule be given for its application by any single person. As well might a man say what others shall hate or what they shall like.

Wherever division of labour exists, and the further it is carried, the more evident does this truth become; scarcely any individual completes of himself any species of produce. Almost every product of art and skill is the result of joint and combined labour. So dependent is man on man, and so much does this dependence increase as society advances, that hardly any labour of any single individual, however much it may contribute to the whole produce of society, is of the least value but as forming a part of the great social task. In the manufacture of a piece of cloth, the spinner, the weaver, the bleacher, and the dyer, are all different persons. All of them, except the first, is dependent for his supply of materials on him, and of what use would his thread be unless the others took it from him, and each performed that part of the task which is necessary to complete the cloth? Wherever the spinner purchases the cotton or wool, the price which he can obtain for his thread, over and above what he paid for the raw material is the reward of his labour. But it is quite plain, that the sum the weaver will be disposed to give for the thread will depend on his view of its utility. Wherever the division of labour is introduced, therefore, the judgment of other men intervenes before the labourer can realise his earnings, and there is no longer any thing which we can call the natural reward of individual labour. Each labourer produces only some part of a whole, and each part, having no value or utility of itself, there is nothing on which the labourer can seize, and say, "this is my product, this I will keep to myself." Between the commencement of any joint operation, such as that of making cloth, and the division of its product among the different persons whose combined exertions have produced it, the judgment of men must intervene several times, and the question is, how much of this joint product should go to each of the individuals whose united labours produce it.

I know no way of deciding this, but by leaving it to be settled by the unfettered judgments of the labourers themselves. If all kinds of labour were perfectly free, if no unfounded prejudice invested some parts, and perhaps the least useful, of the social task with great honour, while other parts are very improperly branded with disgrace, there would be no difficulty on this point, and the wages of individual labour would be justly settled by what Dr. Smith calls the "bidding of the market." Unfortunately labour is not, in general free; and, unfortunately, there are a number of prejudices which decree very different rewards to different species of labour from those which each of them merits.

Unfortunately, also, there is, I think, in general, a disposition to restrict the term labour to the operation of the hands. But if it should be said, that the skill of the practised labourer is a mere mechanical sort of thing, nobody will deny that the labour by

which he acquired that skill was a mental exertion. The exercise of that skill, also, as it seems to me, requiring the constant application of judgment, depends much more on a mental than on a bodily acquirement. Probably the mere capacity of muscular exertion is as great, or greater, among a tribe of Indians, as among the most productive Europeans; and the superior productive power of Europeans, and of one nation over another, arises from the different nature of their fixed capital. But I have shown that the greater efficacy of fixed capital depends on the skill of the labourer; so that we come to the conclusion that not mere labour, but mental skill, or the mode in which labour is directed, determines its productive powers. I therefore would caution my fellow-labourers not to limit the term labour to the operations of the hands.

Before many of our most useful machines and instruments could be invented, a vast deal of knowledge gathered in the progress of the world by many generations, was necessary. At present also, a great number of persons possessed of different kinds of knowledge and skill, must combine and co-operate, although they have never entered into any express contract for this purpose, before many of our most powerful machines can be completed, and before they can be used. The labour of the draftsman is as necessary to construct a ship, as the labour of the man who fastens her planks together. The labour of the engineer who "in his mind's eye," sees the effect of every contrivance, and who adapts the parts of a complicated machine to each other, is as necessary to the completion of that machine as the man who casts or fits any particular part of it, without being sensible of the purpose for which the whole is to serve. In like manner the labour and the knowledge of many different persons must be combined before almost any product intended for consumption can be brought to market. The knowledge and skill of the master manufacturer, or of the man who plans and arranges a productive operation, who must know the state of the markets and the qualities of different materials, and who has some tact in buying and selling, are just as necessary for the complete success of any complicated operation, as the skill of the workmen whose hands actually alter the shape and fashion of these materials. Far be it, therefore, from the manual labourer, while he claims the reward due to his own productive powers, to deny its appropriate reward to any other species of labour, whether it be of the head or the hands. The labour and skill of the contriver, or of the man who arranges and adapts a whole, are as necessary as the labour and skill of him who executes only a part, and they must be paid accordingly.

I must, however add, that it is doubtful whether one species of labour is more valuable than another; certainly it is not more necessary. But because those who have been masters, planners, contrivers, &c. have in general also been capitalists, and have thus had a command over the labour of those who have worked with their hands, their labour has been paid as much too high as

common manual labour has been under paid. The wages of the master, employer, or contriver, has been blended with the profit of the capitalists, and he may probably be still disposed to claim the whole as only the proper reward of his exertions. On the other hand, manual labourers, oppressed by the capitalist, have never been paid high enough, and even now are more disposed to estimate their own deserts rather by what they have hitherto received, than by what they produce. This sort of prejudice makes it, and will long make it difficult, even for the labourers themselves to apportion with justice the social rewards, or wages of each individual labourer. No statesmen can accomplish this, nor ought the labourers to allow any statesman to interfere in it. The labour is theirs, the produce ought to be theirs, and they alone ought to decide how much each deserves of the produce of all. While each labourer claims his own reward, let him cheerfully allow the just claims of every other labourer; but let him never assent to the strange doctrine that the food he eats, and the instruments he uses, which are the work of his own hands, become endowed by merely changing proprietors, with productive power greater than his, and that the owner of them is entitled to a more abundant reward than the labour, skill, and knowledge, which produce and use them.

Masters, it is evident, are *labourers* as well as their journeymen. In this character their interest is precisely the same as that of their men. But they are also either capitalists or the agents of the capitalist, and in this respect their interest is decidedly opposed to the interest of their workmen. As the contrivers and enterprizing undertakers of new works, they may be called employers as well as labourers, and they deserve the respect of the labourer. As capitalists, and as the agents of the capitalist, they are merely middle men, oppressing the labourer, and deserving of any thing but his respect. The labourer should know and bear this in mind. Other people should also remember it, for it is indispensable to correct reasoning to distinguish between these two characters of all masters. If by combining, the journeymen were to drive masters, who are a useful class of labourers, out of the country,—if they were to force abroad the skill and ingenuity which contrive, severing them from the hands which execute, they would do themselves and the remaining inhabitants considerable mischief. If, on the contrary, by combining they merely incapacitate the masters from obtaining any profit on their capital, and merely prevent them from completing the engagements they have contracted with the capitalist, they will do themselves and the country incalculable service. They may reduce or destroy all together the profit of the idle capitalist—and from the manner in which capitalists have treated labourers, even within our own recollection, they have no claim on the gratitude of the labourer,—but they will augment the wages and rewards of industry, and will give to genius and skill their due share of the national produce. They will also increase prodigiously the productive power of the country by increasing the number of

skilled labourers. The most successful and widest spread possible combination to obtain an augmentation of wages would have no other injurious effect than to reduce the incomes of those who live on profit and interest, and who have no just claim, but custom, to any share of the national produce.

It has, indeed, been said by some sapient legislators, both Lords and Commoners, that the journeymen will do themselves incalculable mischief by driving capital out of the country; and one of the reasons urged for the new law, was, that it would prevent the journeymen injuring themselves. Whenever the devil wants to do mischief he assumes the garb of holiness, and whenever a certain class of persons wish to commit a more than usually flagrant violation of justice, it is always done in the name of humanity. If the labourers are disposed blindly to injure themselves, I see no reason for the legislature interfering to prevent them; except as a farmer watches over the health of his cattle, or a West India planter looks after the negroes because they are his property, and bring him a large profit. The journeymen, however, know their own interest better than it is known to the legislature; and they would be all the richer if there were not an idle capitalist in the country. I shall not enter into any investigation of the origin of this opinion that the workmen will injure themselves by driving away capital; but it would not be *difficult* to shew that it springs from the false theory I have opposed, and that it is based on a narrow experience. Because there are a few instances of *political* and *religious* persecution, driving both masters and journeymen, or a large quantity of the national stock of skilled labour, from different countries, greatly, I admit, to the injury, and justly so, of the remaining inhabitants who permitted or practised this persecution; it has been asserted that this injury was caused by the banishment, not of the men but of the capital; and it being therefore now concluded that the proceedings of the workmen, will in like manner banish capital from this country, it has been affirmed that they will injure both themselves and the rest of the inhabitants. But they carry on neither political nor religious persecution, and it is somewhat preposterous in the race of politicians, by way, perhaps, of throwing a veil over their own crimes, to attribute to the actions of the workmen the same consequences as have been produced by some of the absurd and cruel proceedings of their own class. If the workmen do not frighten away the skill of the contriver and the master—and where can that be put to so good a use as where there are plenty of skilful hands? and even if they should, the wide spread of education among the mechanics and artizans will soon repair the loss, they will frighten away no other part of the national advantages. The merest tyro in political economy knows that the capitalist cannot export any great quantity of food, clothing, and machines from this country, nor even the gold and silver which forms the current coin of the realm to any advantage; either he must bring back an equivalent, which returns him a profit when consumed

here; or he must carry with him those skilled labourers, who have hitherto produced him his profit as they have consumed his food and used his instruments and machines. There is not a political injury on the one hand, and both masters and workmen on the other; but on the one side is the labourer, and on the other the capitalist, and however successful the workmen may be, the smallest fraction of their produce which the capitalist can scrape up, he will assuredly stay to collect. The combination of the workmen will not frighten away their own skill, nor unlearn them what they have learned. Their hand will not forget its cunning, when its produce goes no longer into the pocket of the capitalist. Capitalists, who can grow rich only where there is an oppressed body of labourers, may probably carry off some of their cloth, and their corn, and their machines, to some country like Prussia, where the poor people can learn nothing but what the King and his schoolmasters please; or like France, where a watchful police allows no man to utter a thought but such as suits the views of a government and a priesthood anxious to restore despotism and superstition; but they cannot, unless the labourers please, carry with them the mouths which consume, or the hands which make their capital useful; and where these are there will be the productive power. Our labourers already possess in an eminent degree the skill to execute, and they are rapidly acquiring also the skill to contrive. Never was there a more idle threat uttered, therefore, than that the combinations of skilled labourers to obtain greater rewards than they now possess will drive skilled labour from the country.

This analysis also of the operations of capital leads us at once boldly to pronounce all those schemes of which we have of late heard so much for improving countries, by sending capital to them, to be mere nonsense. Of what use, for example, would the butter and salt-beef, and pork, and grain now exported from Ireland, be of in that country, if they were to be left there, or if they were to be sent back? All these articles form some of the most valuable parts of circulating capital, and so far from there being any want of them in Ireland, they are constantly exported in great quantities. It is plain, therefore, that there is no want of circulating capital in Ireland, if the capitalist would allow the wretched producer of it to consume it. Of what use also would steam engines, or power looms, or stocking frames, or mining tools be of to the ragged peasantry of Ireland? Of none whatever. If, indeed, masters and journeymen went over with these instruments and tools, they might use them, and by consuming at the same time the circulating capital now exported from Ireland give the owner of it a large profit; and they might teach the ignorant and helpless natives how to make use of the various instruments I have mentioned. Those who talk of improving Ireland, or any other country, by capital have a double meaning in their words. They know the power of the capitalist over the labourer, and that whenever the master goes or sends, there also must the slave-labourer go. But neither the law-

maker nor the capitalist possesses any miraculous power of multiplying loaves and fishes; or of commanding, like the enchanters of old, broomsticks, to do the work of men. They must have labourers, skilled labourers, and without them it is nonsense to talk of improving a country and a people by corn and cloth and hatchets and saws.

The wide spread of education among the journeyman mechanics of this country, diminishes daily the value of the labour and skill of almost all masters and employers, by increasing the number of persons who possess their peculiar knowledge. At the same time, masters and employers cannot hope that the labourers who are not capitalists will remain long ignorant of the manner in which masters—who are both labourers and capitalists, lend themselves to the views of the capitalists who are not labourers. They are daily acquiring this knowledge, and masters cannot therefore rationally expect a termination to the present contest. On the contrary, it must continue. Even if it should be stopped it will again and again occur. It is not possible that any large body of men who are acquainted with their rights will tacitly acquiesce in insult and injury. The profits of the masters, as capitalists, must be diminished, whether the labourers succeed in obtaining higher wages, or the combination continues, or it is from time to time renewed. In the former case, the masters, as skilled labourers, will share in the increased rewards of industry; in either of the two latter, not only will their profit be destroyed, but their wages will be diminished or altogether annihilated. Without workmen their own skill and labour are of no use, but they may live in comfort and opulence without the capitalist. Masters and employers, therefore, would do well to recollect, that by supporting the claims of capital they diminish their own wages, and they prolong a contest which, independent of the ill-temper and hatred it creates and perpetuates, is also injurious to them as inventors, contrivers and skilled labourers, and which must ultimately terminate to their disadvantage.

The improved education of the labouring classes ought, in the present question, to have great weight also with statesmen, and with the community at large. The schools, which are every where established, or are establishing, for their instruction, make it impossible for the greatest visionary to suppose that any class of men can much longer be kept in ignorance of the PRINCIPLES on which societies are formed and governed. Mechanics' Institutions will teach men the moral as well as the physical sciences. They excite a disposition to probe all things to the bottom, and supply the means of carrying research into every branch of knowledge. He must be a very blind statesman who does not see in this, indications of a more extensive change in the frame of society than has ever yet been made. This change will not be effected by violence, and cannot be counteracted by force. No Holy Alliance can put down the quiet insurrection by which knowledge will subvert whatever

is not founded in justice and truth. The interest of the different classes of labourers who are now first beginning to think and act as a body, in opposition to the other classes among whom, with themselves, the produce of the earth is distributed, and who are now only for the first time beginning to acquire as extensive a knowledge of the principles of government as those who rule, is too deeply implicated by these principles to allow them to stop short in their career of enquiry. They may care nothing about the curious researches of the geologist, or the elaborate classification of the botanist, but they will assuredly ascertain why they only, of all the classes of society, have always been involved in poverty and distress. They will not stop short of any ultimate truth; and they have experienced too few of the advantages of society to make them feel satisfied with the present order of things. The mind is rather invigorated than enfeebled by the labour of the hands; and they will carry forward their investigations undelayed by the pedantry of learning, and undiverted by the fastidiousness of taste. By casting aside the prejudices which fetter the minds of those who have benefitted by their degradation, they have every thing to hope. On the other hand, they are the sufferers by those prejudices, and have every thing to dread from their continuance. Having no reason to love those institutions which limit the reward of labour, whatever may be its produce, to a bare subsistence, they will not spare them, whenever they see the hollowness of the claims made on their respect. As the labourers acquire knowledge, the foundations of the social edifice will be dug up from the deep beds into which they were laid in times past, they will be curiously handled and closely examined, and they will not be restored unless they were originally laid in justice, and unless justice commands their preservation.

Without joining in any of the common-place observations against taking interest, and against usury, which, however, support my view of capital, I have shown that it has no just claim to any share of the labourer's produce, and that what it actually receives is the cause of the poverty of the labourer. It is impossible that the labourer should long remain ignorant of these facts, or acquiesce in this state of things.

In truth, also, however the matter may be disguised, the combinations among workmen to obtain higher wages, which are now so general and so much complained of, are practical attacks on the claims of capital. The weight of its chains are felt, though the hand may not yet be clearly seen which imposes them. Gradually as the resistance increases, as laws are multiplied for the protection of capital, as claims for higher wages shall be more strenuously and more violently repressed, the cause of this oppression will be more distinctly seen. The contest now appears to be between masters and journeymen, or between one species of labour and another, but it will soon be displayed in its proper characters; and will stand confessed a war of honest industry against the idle profligacy which has so long

ruled the affairs of the political world with undisputed authority—which has, for its own security, added honour and political power to wealth, and has conjoined exclusion and disgrace with the poverty it has inflicted on the labourer. On the side of the labourers there is physical strength, for they are more numerous than their opponents. They are also fast losing that reverence for their opponents which was and is the source of their power, and they are daily acquiring a moral strength which results from a common interest and a close and intimate union.

The capitalists and labourers form the great majority of the nation, so that there is no third power to intervene betwixt them. They must and will decide the dispute of themselves. Final success, I would fain hope, must be on the side of justice. I am certain, however, that till the triumph of labour be complete; till productive industry alone be opulent, and till idleness alone be poor; till the admirable maxim, “that he who sows shall reap,” be solidly established; till the right of property shall be founded on principles of justice, and not on those of slavery; till *man* shall be held more in honour than the clod he treads on, or the machine he guides—there cannot, and there ought not to be either peace on earth or good-will amongst men.

Those who of late have shown themselves so ready to resist the just claims of labour, who, under the influence of interest and passion, have hurried into the arena with their penal laws, and have come forward, brandishing their parchment statutes, as if they, poor beings, could whip mankind into patience and submission, when these weapons of theirs—these penal laws and parchment statutes—derive all their power, whether for evil or for good, from the sanctity with which we are pleased to invest them, and as if they also did not know that they are as powerless as the meanest individual whom they are so prompt to scourge, except as we are pleased to submit and to honour them,—they may thank themselves should their haste and their violence beget a corresponding haste and violence in others; and, should the labourers, who have hitherto shown themselves confiding and submissive—losing that reverence by which laws are invested with power, and to which Government is indebted for its existence—turn their attention from combining for higher wages, to amending the state, and to subverting a system which they must now believe is intended only to support all the oppressive exactions of capital. Ministers are undoubtedly, for the moment, very popular, but it does not require any very enlarged view to predict, that by openly committing the Government during the last session of Parliament, when the great mass of the community are able both to scan the motives of their conduct and its consequences, and zealous in doing it, to a contest between capital and labour, taking the side of idleness against industry, of weakness against strength, of oppression against justice, they are preparing more future mischief than any.

ministry this country has ever seen. They profess liberal principles—and they make laws to keep the labourer in thralldom. By their innovations they encourage enquiry, and convince us the system is neither sacred nor incapable of improvement. They have practically told the labourer there is nothing deserving his reverence, and have excited his hostility both by insult and oppression.

I do not mean, on the present occasion, to point out all the consequences which result from this view of capital, but there is one, so important in a theoretical point of view, and so well calculated to relieve the wise system of the universe from the opprobrium which has been cast upon it in these latter times, that I cannot wholly pass it by. An elaborate theory has been constructed, to show that there is a *natural* tendency in *population* to increase faster than *capital*, or than the means of *employing labour*. In Mr. Mill's *Elements of Political Economy*, a work distinguished by its brevity, several sections and pages are devoted merely to announce this truth. If my view of capital be correct, this, as a theory of nature, falls at once baseless to the ground. That the capitalist can controul the existence and number of labourers, that the whole number of the population depends altogether on him, I will not deny. But, put the capitalist, the oppressive middle man, who eats up the produce of labour, and prevents the labourer from knowing on what *natural* laws his existence and happiness depend, out of view—put aside those social regulations by which they who produce all are allowed to own little or nothing—and it is plain that *capital*, or the **POWER TO EMPLOY LABOUR, and CO-EXISTING LABOUR** are **ONE**; and, that **PRODUCTIVE CAPITAL and SKILLED LABOUR** are also **ONE**; consequently capital and a labouring population are precisely synonymous.

In the system of nature, mouths are united with hands and with intelligence; they, and not capital, are the agents of production; and, according to her rule, however it may have been thwarted by the pretended wisdom of lawmakers, wherever there is a man there also are the means of creating or producing him subsistence. If also, as I say, circulating capital is only co-existing labour, and fixed capital only skilled labour, it must be plain, that all those numerous advantages, those benefits to civilization, those vast improvements in the condition of the human race, which have been in general attributed to capital, are caused in fact by labour, and by knowledge and skill informing and directing labour. Should it be said, then, as perhaps it may, that unless there be profit, and unless there be interest, there will be no motives for accumulation and improvement; I answer, that this is a false view, and arises from attributing to capital and saving those effects which result from labour; and, that the best means of securing the progressive improvement, both of individuals and of nations, is to do justice, and allow labour to possess and enjoy the whole of its produce.
